# AI product prototyping

We build working prototypes of your AI features fast, so you can test real assumptions before committing engineering time.

## Behaviour you can try, not a spec you read

A spec document

**"The assistant should summarise the thread."**

A sentence that sounds reasonable — until you see what "summarise" actually produces, how long it takes, and whether users trust the result. The doc can't answer any of that.

A working prototype

**"Here's the summary — react to it."**

We prototype the interface and the AI's expected responses side by side, so you can see how a feature really behaves and put it in front of real users early — before full development starts.

## Match the fidelity to the question

You don't need a real model to learn something. Pick the cheapest prototype that answers the question in front of you — climb the ladder only as certainty demands it.

| | | |
|---|---|---|
| 01 | Scripted mock | HOURS |
| 02 | Wizard-of-Oz | DAYS |
| 03 | Live model | A SPRINT |

"Do users trust the answers when they feel real?"

| | |
|---|---|
| AI RESPONSES | WHAT IT TESTS |
| A human plays the AI, live behind the screen | Reactions to realistic, varied output — without a model |
| TIME TO BUILD | BEST FOR |
| 2–4 days | Pressure-testing trust and tone before any engineering. |

**Interface + response, together**

We prototype what the AI says alongside the screen — that pairing is the thing users react to.

**Cheapest test that works**

Start with the flows that matter most, not every edge case, at the lowest fidelity that answers the question.

**Real users, early**

We put it in front of people outside the building — not just internal demos.

**Disposable on purpose**

The prototype is for learning, not shipping. Validated flows become the baseline for the real build.

## Learn what's wrong in days, not after launch

**Test before you build**

Validate whether an AI feature actually works for users before committing engineering resources.

**See real behaviour, not a spec**

A working prototype shows how the AI responds — a document describing it can't.

**Catch problems early**

Unclear flows, confusing responses, and trust issues surface in a prototype, not after launch.

**Faster iteration**

Prototypes can be revised in days, not sprints, so you can test more ideas before choosing one.

## Six principles behind the work

01

**Interface and AI together**

We prototype the responses alongside the screens, never in isolation.

02

**Flows that matter first**

03

**Real users, early**

## Prototyped in the wild

A few frames off the sheet — AI features we mocked, tested, and proved before the build.

## Frequently asked questions

- How is this different from a regular clickable prototype? +
- Do you build a real AI model, or fake the responses? +
- How long does a prototype take? +
- What do I get at the end? +

## Not sure your AI feature works *until real users try it?*

Tell us the assumption you're least sure about. We'll build the cheapest prototype that tests it and put it in front of real users — in days.

Prototype your AI feature
