Design systems

A single, reusable set of components, patterns, and rules — so every screen your team ships looks and behaves like it belongs to the same product.

One source of truth, not a folder of screens

DEFINITION

“Design and code, building from the same parts.”

A design system is a shared set of reusable components, patterns, and design tokens — colour, type, spacing, iconography — paired with the rules for using them.

WHAT'S INSIDE

- **Tokens**
  Colour, type, spacing, and iconography defined once.
- **Components**
  Buttons, forms, cards, navigation — every variant and state.
- **Guidelines**
  The rules for when and how each pattern is used.
- **Accessibility**
  WCAG standards baked into the base components.

Change a token, change everything

Tokens are the source, components are downstream. Move the accent or the corner radius and watch every component update at once — that's the whole point of a system.

ACCENT TOKEN

COMPONENTS — ALL DOWNSTREAM

Primary Secondary Badge

Account overview

Every surface inherits the same tokens — no screen drifts off on its own.

- **Tokens before components**
  Colour, type, and spacing are defined once, then everything references them.
- **Update once, propagate everywhere**
  A single change flows to every place the token is used — no screen-by-screen fixes.
- **Every variant and state documented**
  Components ship with their defaults, hovers, disabled, and error states spelled out.
- **One source for design and code**
  The same system lives in Figma and in the codebase, not two versions drifting apart.

Design once, reuse everywhere

Consistency at scale

Every new screen inherits the same components and rules, instead of being designed from zero.

Faster shipping

Teams build from existing patterns rather than reinventing basic components on every project.

Easier collaboration

Design and engineering share the same source of truth, cutting down on handoff friction and rework.

Cheaper to maintain

A single component updated once propagates everywhere it's used, instead of fixing the same thing across dozens of screens.

Six principles behind the work

01 **Tokens before components**
Colour, type, and spacing are defined once, at the base.

02 **Documented variants and states**
Every component ships with all its variants and states spelled out.

03 **Accessibility at the base**
WCAG standards are built into base components, not layered on later.

04 **One source of truth**
Design and engineering build from the same system, in sync.

05 **Governed, not abandoned**
Someone owns updates and additions so it stays coherent.

06 **Built to scale**
The system grows with the product, not just today’s screens.

Systematised in the wild

A few frames off the sheet — products with a system holding every screen together.

COMMON QUESTIONS

Frequently asked questions

01 What's actually included in a design system? ×

Design tokens (color, type, spacing), a documented component library (buttons, forms, cards, navigation), usage guidelines, and accessibility standards baked into each component — not just a Figma file of screens.

02 Do we need one if we're a small team? +

03 Who maintains it after it's built? +

04 What do I get at the end? +

Tired of every new screen *looking like a different product?*

Tell us where the drift is worst. We'll build the tokens, components, and guidelines your team can build from — in Figma and in code.
